                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Db
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB18999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT
                          The present sequence is derived from a human core 2
CC beta-1,6-N-acetylglycosaminyltransferase (core2b GlcNAc-T) polypeptide.
CC The polypeptide can be used to treat diseases and disorders, such as CC cancer, cardiovascular disorders and inflammatory disorders. Such as CC cancer, rheumatoid arthritis, inflammatory bowel disease, arteriosclerosis, septic shock, adult respiratory distress syndrome CC (ARDS) and cancer. Various platelet-mediated pathologies such as CC (ARDS) and cancer. Various platelet-mediated pathologies such as CC athersclerosis and clotting can also be treated. The polypeptides of the invention are predominantly expressed in gastrointestinal tissue CC (stomach, colon, intestine, testis) and are elevated in cancer. CC (astrointestinal disorders that may be prevented or treated include ascites, choicelithiaseis, cirrhosis, Crohn's disease, diverticulitis communo-histochemical analysis, to detect the novel polypeptide and to clocalize it to particular cells and tissues and to specific subcellular collations and to quantitate the level of expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rheumatoid arthritis; inflammatory bowel disease; arteriosclerosis; septic shock; adult respiratory distress syndrome; ARDS; cancer; platelet-mediated pathology; athersclerosis; gastrointestinal disorder; clotting; ascites; cholelithiasels; cirrhosis; Crohn's disease; diverticulitis; ulcerative colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-FEB-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         03-AUG-2000

CC beta-1,6-N-acetylglycosaminyltransferase (core2b GlcNAc-T) polypeptide.

CC The polypeptide can be used to treat diseases and disorders, such as CC cancer, cardiovascular disorders and inflammatory disorders including casthma, rheumatoid arthritis, inflammatory bowel disease,

CC arteriosclerosis, septic shock, adult respiratory distress syndrome (ARDS) and cancer. Various platelet-mediated pathologies such as CC the invention are predominantly expressed in gastrointestinal tissue (Stomach, colon, intestina, testis) and are elevated in cancer. CC (astrointestinal disorders that may be prevented or treated include ascites, cholelithiaseis, cirrhosis, Crohn's disease, diverticulitis and ulcerative colitis. The antibodies may be used in colon, intestinal colon colons, the antibodies may be used in colon colons and ulcerative colitis, the antibodies may be used in colons into particular cells and tissues and to specific subceilular colorations and to quantitate the level of expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 3;

                                                                                                                                                                                                                                                                                                                                                                                             В
                                                                                                                                                                                                                                                                                                                                                                                                                           QY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is human UDP-N-acetylglucosamine:

CX N-acetylgalactcsamine beta-1,6-N-acetylglucosaminyltransferase

CX (C2/4GnT). C2/4GnT is the third member of the family of 0-glycan

CX beta-1,6-N-acetylglucosaminyltransferases. It adds core 2 or core 4

CX based 0-glycans on to oligosaccharides, glycoproteins and

CX depropriately glycosylated glycoconjugates with particular enzymatic,

CX immunogenic, or other biological or physical properties. The nucleotide

CX sequence is useful as a probe for the detection of C2/4GnT from other

CX species and related organisms and for the recombinant production of

CX/4GnT polypeptide. The nucleotide sequence was identified by analysis

CX of EST database sequence information. Oligonucleotides derived from EST

CX clone 17865 of ATCX were used to isolate two full-length C2/4GnT clones

CX performed using Colo205 human cell library by 5' RACE PCR. RT-PCR was

CX performed using Colo205 human cell library by 5' RACE PCR. RT-PCR was

CX performed using Colo205 human cell library by 5' RACE PCR. RT-PCR was

CX cons 17865 of C2/4GnT in Sf9. The control of 0-glycan core assembly

CX has been implicated in tumour progression and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           03-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB30518
                                                                                                                                                                                                                                                                 membrane protein that is predominantly expressed in colon, small intestine, trachea, stomach and thyroid, as well as in certain cancer cell lines. C26nT-M polypeptides may be used to prepare molecules having highly branched stalyl Lex and L-selectins, which may be subsequently used to modulate immune reactions, e.g. inflammation and tissue rejection, and to prevent or inhibit tumour metastasis.

AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54008 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Agonists and antagonists to the antigens can be screened for. The pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiinflammatory; cardiant; gene therapy; chromosome mapping;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    analysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a partial human core 2
CC beta-1,6 N-acetyjelycosaminyltransferase (core2b GleNAc-T) polypeptide.
CC The polypeptide can be used to treat diseases and disorders, such as cancer, cardiovascular disorders and inflammatory disorders including casthma, rheumatoid arthritis, inflammatory bowel disease, earteriosclerosis, septic shock, adult respiratory distress syndrome (CC atteriosclerosis, septic shock, adult respiratory distress syndrome (CRDS) and cancer. Various platelet-mediated pathologies such as cathersclerosis and clotting can also be treated. The polypeptides of CC atheristic are predominantly expressed in gastrointestinal tissue (stomach, colon, intestine, testis) and are elevated in cancer. CC Gastrointestinal disorders that may be prevented or treated include ascites, cholelithiasels, cirrhosis, Crohn's disease, diverticulitis cand ulcerative colitis. The antibodies may be used in continuon-histochemical analysis, to detect the novel polypeptide and to coations and to quantitate the level of expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                     ₽,
                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                ρy
                                                                                                                                                                                                                                                                                                                                                                                                                       comay be used to prevent or treat cardiomyopathy associated with diabetes and hyperglycaemia. This method involves reacting core 2 GlcNAc-T C (UDP-GlcNAc:Galbetal-3GALNAc-alphaR betta-1,6-N-acetylglucosaminy1-C (TUDP-GlcNAc:Galbetal-3GALNAC-alphaR betta-1,6-N-acetylglucosaminy1-C transferase) with an acceptor substrate and a sugar nuclectide donor in the presence of a test substance under conditions whereby the core 2 GlcNAc-T produces a reaction product, determining the amount of reaction product, and comparing the amount of reaction product with the amount of obtained in the absence of the test substance, where lower amounts of creation product in the presence of the test substance indicate that the cuber transferace in the preventing or treating cardiomyopathy associated with the core 2 GlcNAc-T. The invention also describes (1) methods for preventing or treating cardiomyopathy associated with 2 Gliabetes and hyperglycaemia, and (2) transgenic nonhuman animal whose 2 Germ cells and somatic cells all contain a DNA construct introduced into 2 the animal or an ancestor of the animal at an embryonic stage, where 2 GlicNac-T download a sometic stage and 2 causes the animal to develop cardiomyopathy similar to that associated 2 C with diabetes mellitus and hyperglycaemia. This sequence represents the 2 C rat DH1 protein which is used to describe the method of the invention.
                                                                                                                                                                                                                                                                                            Query Match 38.9

                         This invention describes a method for screening for a substance that may be used to prevent or treat cardiomyopathy associated with diabetes and hyperglycaemia. This method involves reacting core 2 GlcNAc-T (UDP-GlcNAc:Galbetal-3GalNAc-alphaR beta-1,6 N-acetylglucosaminyl-transferase) with an acceptor substrate and a sugar nucleotide donor in the presence of a test substance under conditions whereby the core 2 GlcNAc-T produces a reaction product, determining the amount of reaction product, and comparing the amount of reaction product with the amount contained in the absence of the test substance, where lower amounts of creation product in the presence of the test substance indicate that the guidance inhibits core 2 GlcNAc-T. The invention also describes (1) contained for preventing or treating cardiomyopathy associated with the presence of the test substance indicate that the control of the core 2 GlcNAc-T. The invention also describes (1) contained to the presence of the test substance indicate that the control of the contain a DNA construct introduced into the animal or an ancestor of the animal at an embryonic stage, where the animal to develop cardiomyopathy similar to that associated with diabetes meditus and hyperglycaemia. This sequence represents the content of the presents and hyperglycaemia. This sequence represents the content of the presents and hyperglycaemia. This sequence represents the content of the presents and hyperglycaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening: treatment; prevention; cardiomyopathy; inhibitor; diabetes mellitus; hyperglycaemia; core 2 GlcNAc-T; acceptor substrate; UDP-GlcNAc:Galbetal-3GalNAc-alphaR; transgenic animal; germ line; beta-1,6-N-acetylglucosaminyl-transferase; human; core 2 GnT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human core 2 GnT protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28-JUN-1999

The enzyme is associated with cardiomyopathy in diabetes and hyperglycaemia sufferers. The invention also provides methods for identifying inhibitors of core 2 GlcNAc-T which can be used to the contract of the contrac

                                                                                                                                                                                                                                                                                                                                                                                                                                                                glycosyltransferases can be isolated by translent expression of in recipient cells, e.g. COS-1. COS-1 cells were transfected with a cDNA library, pcDSR alpha-2F1, constructed from poly(A)+ of activated T lymphocytes which express the C2GnT. Transfected cells were selected using MAD 7305, which identifies a hexasacharide on leukosialin. Leukosialin CD43 is an acceptor molecule for C2GnT activity. A plasmid, pcD5R alpha-Leu, which directed expression of the T305 antigen was identified. The CDNA insert was isolated and sequenced. The cDNA encoded the acceptor molecule leukosialin CD43:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Key

                                                                                                                                                                                                                                             The present invention describes the human UDP-GlcNAc:Galbetal-3GalNAc alphaR betal-6 N-acetylglucosaminyltransferase (core 2 GlcNAc-T) protein and coding sequences. The enzyme is constanted with cardiomyopathy in diabetes and hyperglycaemia sufferers. The invention also provides methods for identifying inhibitors of core 2 GlcNAc-T which can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                          reverse-transcribed and inserted into expression vector pcDNAI. Plasmid DNA was used to transfect CHO-Py-Leu cells. Transfected cells were screened using human anti-I antigen antibodies and goat anti-human IgM. Plasmid DNA was analyzed to obtain DNA (given in AAQ89201) encoding I-branching enzyme (AAR71932).
                                                                                                                                                         Nucleic acid encoding I-branching enzyme \cdot used to develop prods for treating e.g. inflammatory responses, tumours or hypersensitivity reactions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human beta-1,6-N-acetylglucosaminyltransferase, I-branching enzyme (IGnT) (AAR92474) is an enzyme that converts blood group i antigen t I antigen. The occurrence of I antigen is associated with development and maturation of erythroid cells. Membrane-bound or soluble forms of IGnT are obtd. by expression of encoding DNA sequences (see AAT16201) in host cells. IGnT is used to study the role of IGnT in development and oncogenesis, to alleviate disorders associated with IGnT underexpression (e.g. haemolytic disease of the newborm, haemolytic anemia and thrombocytopenia), to regulate IGnT expression, and in detection and diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents human beta-1,6-N-acetylglucosaminyltransferase, the I-branching enzyme (IGnT). The protein sequence has a type II transmembrane topology that consists of a short amino terminal cytoplasmic sequence, a signal-anchor sequence followed by a short stem region and a large carboxyl terminal catalytic domain. The protein shows some homology to core 2-beta--1,I-N-acetylglucosaminyltransferase (C2GnT). The nucleic acid sequence is used for producing IGnT polypeptides, which can be used to treat disorders arising from under expression of IGnT, e.g. increased susceptibility to type-II hypersensitivity reactions such as meonattal haemolytic disease, autoimmune haemolytic anaemia and thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid sequences and their complementary sequences - useful for producing fragment of recombinant human I-branching -1,6-N-acetyl-glucosaminyl-transferase polypeptide

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                       Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (UDP-GLONAC: balbecal, bearer again. C2GnT3). C2GnT3 and nucleic acids encoding it are useful in the particularly a thymus-related disorder. C2GnT3, nucleic acids encoding it and antibodies against it may also be used for in vitro purposes related to scientific research, DNA synthesis and manufacture of vectors, in the prognostic and diagnostic evaluation of conditions associated with altered expression or activity of C2GnT3 or conditions by detecting and localising the DNA and protein. Disorders such as tumours (e.g. malignant melanoma, adenoma and sarcoma) and cancers (e.g. of the breast or cervix), hypoactivity, hyperactivity, atrophy, enlargement of the breast or cervix), hypoactivity, hyperactivity, atrophy, enlargement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                breast or červix), hypoactivity, hyperactivity, atrophy, enlargement of thymus, autoimmunity, arthritis, leukaemia, lymphomas, immunosuppression acquired immunodeficiency syndrome (AIDS), Wiskott-Aldrich syndrome, sepsis, wound healing, acute and chronic infection, cell-mediated or humour immunity, or THI/TH2 imbalance, may be treated using these protein or nucleic acid. The antibodies may be used to screen potential therapeutic compounds to determine their effects on a conditions such as thymus-related disorder or cancer, to determine the level of C20nT3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB18995
(stomach, colon, intestine, testis) and are elevated in cancer. Gastrointestinal disorders that may be prevented or treated incl ascittes, cholelithiaseis, cirrhosis, Crohn's disease, diverticul and ulcerative colitis. The antibodies may be used in immuno-histochemical analysis, to detect the novel polypeptide a localize it to particular cells and tissues and to specific subt
                                                                                                                                                                              beta-1,6-N-acetylglycosaminyltransferase (core2b GlcNAc-T) polypeptide. The polypeptide can be used to treat diseases and disorders, such as cancer, cardiovascular disorders and inflammatory disorders including asthma, rheumatoid arthritis, inflammatory bowel disease, arteriosclerosis, septic shock, adult respiratory distress syndrome (ARDS) and cancer. Various platelet-mediated pathologies such as athersolerosis and clotting can also be treated. The polypeptides of the invention are predominantly expressed in gastrointestinal tissue interestinal intestinal tassue invented in cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diverticulitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  septic shock; adult respiratory distress syndrome; ARDS; cancer; platelet-mediated pathology; athersclerosis; gastrointestinal disorder; clotting; ascites; cholelithiaseis; cirrhosis; Crohn's disease;

CC (C2/4GnT). C2/4GnT is the third member of the family of O-glycan CC beta-1,6-N-acetylglucosaminyltransferases. It adds core 2 or core 4 CC based O-glycans on to oligosaccharides, glycoproteins and CC glycosphingolipids. C2/4GnT can therefore be used in the production of CC glycosphingolipids. C2/4GnT can therefore be used in the production of CC immunogenic, or other biological or physical properties. The nucleotide CC immunogenic, or other biological or physical properties. The nucleotide Sequence is useful as a probe for the detection of C2/4GnT from other CC c2/4GnT polypeptide. The nucleotide sequence was identified by analysis CC c2/4GnT polypeptide. The nucleotide sequence was identified by analysis CC cone 17865 of ATCC were used to isolate two full-length C2/4GnT clones CC from a human foreskin genomic plilibrary by 5' RACE pCR. RT-PCR was CC for expression of C2/4GnT in sf9. The control of O-glycan core assembly has been implicated in tumour progression and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is human UDP-N-acetylglucosamine:
N-acetylgalactosamine beta-1.6-N-acetylglucosaminyltransferase
(C2/4GnT): C2/4GnT is the third member of the family of O-glycc
beta-1.6-N-acetylglucosaminyltransferases. It adds core 2 or oc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule encoding UDP-N-acetylglucosamine useful as probe for the detection of specified glucoseaminyltransferase from other species and related organisms

                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human beta-1-6-N-acetylglucosaminyltransferase polypeptide, with core2, core4 and I branching activities. It is designated C2GnT-M. C2GnT-M is a membrane protein that is predominantly expressed in colon, small intestine, trachea, stomach and thyroid, as well as in certain cancer cell lines. C2GnT-M polypeptides may be used to prepare molecules having highly branched sialyl Lex and L-selectins, which may be subsequently used to modulate immune reactions, e.g. inflammation and tissue rejection, and to prevent or inhibit tumour metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New C2GnT-M polypeptides having core 2, core 4 and I branching beta-1-6-N-acetylglucosaminyltransferase activities for prepar reagents useful for diagnosing, preventing or treating inflamm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      В
                                                              The present sequence represents a partial human core 2
The polypeptide can be used to treat diseases and disorders, such as cancer, cardiovascular disorders and inflammatory disorders including asthma, rheumatoid arthritis, inflammatory bowel disease, arteriosclerosis, septic shock, adult respiratory distress syndrome (ARDS) and cancer. Various platelet-mediated pathologies such as athersclerosis and clotting can also be treated. The polypeptides of the invention are predominantly expressed in gastrointestinal tissue (stomach, colon, intestine, testis) and are elevated in cancer. Gastrointestinal disorders that may be prevented or treated include ascites, cholelithiasels, cirrhosis, Crohn's disease, diverticulitis and ulcerative colltis. The antibodies may be used in immuno-histochemical analysis. to date of the contraction of the incomplete collitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       rhounatoid arthritis; inflammatory bowel disease; arteriosclerosis; septic shock; adult respiratory distress syndrome; ARDS; cancer; platelet-mediated pathology; athersclerosis; gastrointestinal disor clotting; ascites; cholelithiaseis; cirrhosis; Crohn's disease; diverticulitis; ulcerative colitis.
